

IBM Resilient

Incident Response Platform Integrations

Risk Fabric Function V1.0.0

Release Date: September 2018

Resilient Functions simplify development of the integrations by sending data from the Resilient platform to a remote program that performs an activity then returns the results to the function. The results can be acted upon by a script and the result of that becomes a decision point in the Resilient workflow.

This guide describes the Risk Fabric Function.

Overview

The Risk Fabric integration with the Resilient platform allows for the querying of Risk Ratings for Artifacts like IPs, Domains, and Users. Risk Models, Event Scenarios, and Action Plans can be pulled into Resilient and created as Incidents.

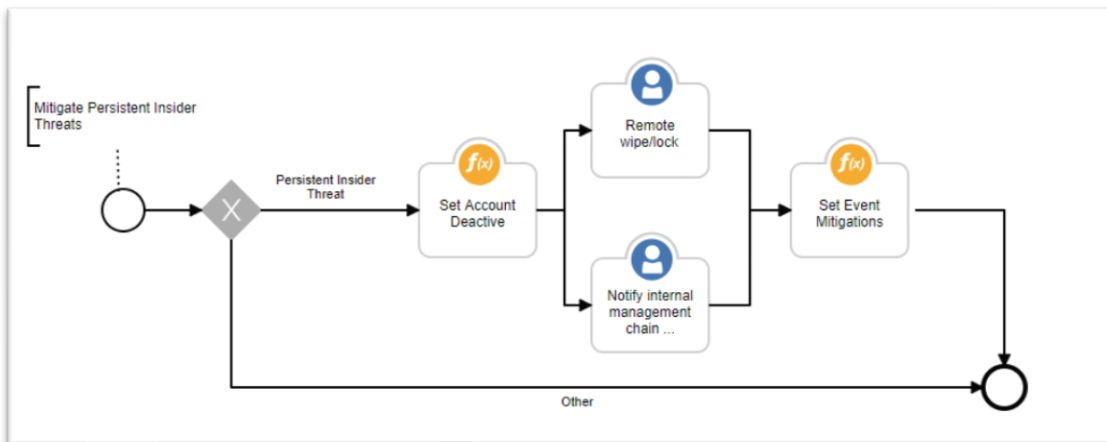

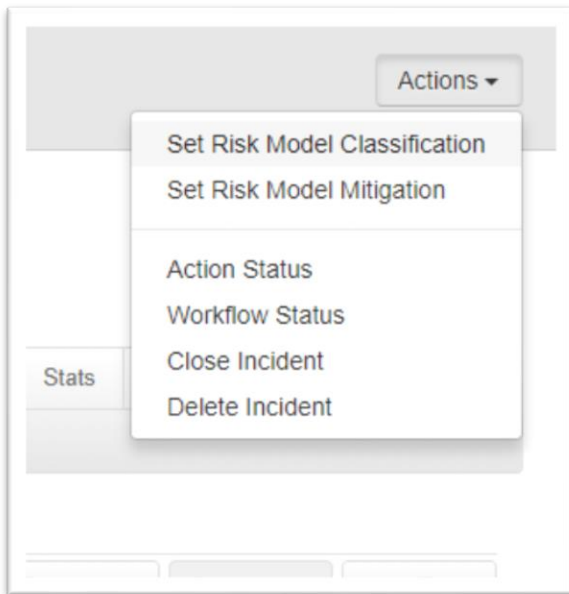

Open Incidents Save As (Private)

Incident Disposition: Confirmed, Un... Name: All Status: Active

42 results Show 100

<input type="checkbox"/>	Incident Type	ID	Name	Description	Date Discovered
<input type="checkbox"/>	Action Plan	2474	High Match Count Unusual	Research user activity and possibly deactivate account.	08/01/2018
<input type="checkbox"/>	Risk Model	2475	Compromised User Kill Chain	Cyber Attack, Joe DeRobertis, #2019	08/01/2018
<input type="checkbox"/>	Risk Model	2476	Compromised User Kill Chain	Cyber Attack, Akilah Austin, #2016	08/01/2018

Automatically or manually perform Classifications and Mitigation actions on Risk Models, Event Scenarios, and Action Plans.

Setup

The following lists the system requirements:

- Python version 2.7.10 or later, or version 3.6 or later
- Resilient Circuits and Resilient Python libraries version 30.0 or later
- Resilient platform version 30.0 or later
- Risk Fabric version 6.5.1 or later

Perform the following to install and configure the function:

1. Ensure the environment is up to date:

```
sudo pip install --upgrade pip
sudo pip install --upgrade setuptools
sudo pip install --upgrade resilient-circuits
```

2. Install the required software for the function (if not already installed):

```
sudo pip install fn_risk_fabric-<version>.tar.gz
```

3. Add the function to the Resilient platform:

```
resilient-circuits customize
```

You are prompted to answer prompts to import functions, message destinations, etc.

4. From the account used for Integrations, use one of the following commands to configure the Risk Fabric settings. Use `-c` for new environments or `-u` for existing environments.

```
resilient-circuits config -c
```

OR

```
resilient-circuits config -u
```

5. Edit the .resilient/app.config file and section [fn_risk_fabric]:

```
server=<risk fabric url>
username=<risk fabric api user>
password=<risk fabric api password>
```

After completing the configuration steps, enter the `resilient-circuits run` command. The following is an example of the resulting messages indicating the successful connection to the Resilient platform and the loading of the Risk Fabric integration modules.

```
$ resilient-circuits run

Resilient Platform Configuration

In the Customization Settings section of the Resilient platform, you can verify that the following Risk Fabric specific functions, workflows and rules are available in the Resilient platform by clicking their respective tabs.

- Functions, Workflows, and Rules
 - **Get Host Risk** – Query the Risk Rating Information for a hostname.
 - **Get IP Risk** – Query the Risk Rating information for an IP address.
 - **Get User Risk** – Query the Risk Rating information for a username.
 - **Get Action Plans** – Query the set of action plans for an account.
 - **Set Action Plan Classification** – Update Event Classification for an Action Plan.
 - **Set Action Plan Mitigation** – Update Mitigation statuses for an Action Plan.
 - **Get Risk Model Instances** – Query the set of Risk Model Instances.
 - **Set Risk Model Classification** – Update the Event Classifications for a Risk Model.
 - **Set Risk Model Mitigation** – Update the Mitigation statuses for a Risk Model.
 - **Get Risk Model Instance Details** – Get the set of Event Scenario for a Risk Model Instance.
 - **Set Scenario Classification** – Update Event Classifications on Risk Model Event Scenarios.
 - **Set Scenario Mitigation** – Update Mitigation statuses on Risk Model Event Scenarios.
 - **Mitigate Persistent Insider Threats** – Example workflow for mitigating persistent insider threats.

Troubleshooting

There are several ways to verify the successful operation of a function.

- Resilient Action Status

When viewing an incident, use the Actions menu to view Action Status. By default, pending and errors are displayed. Modify the filter for actions to also show Completed actions. Clicking on an action displays additional information on the progress made or what error occurred.
- Resilient Scripting Log

A separate log file is available to review scripting errors. This is useful when issues occur in the pre-processing or post-processing scripts. The default location for this log file is:

```
/var/log/resilient-scripting/resilient-scripting.log
```

- Resilient Logs

By default, Resilient logs are retained at `/usr/share/co3/logs`. The `client.log` may contain additional information regarding the execution of functions.

- Resilient-Circuits

The log is controlled in the `.resilient/app.config` file under the section `[resilient]` and the property `logdir`. The default file name is `app.log`. Each function creates progress information. Failures show up as errors and may contain Python trace statements.

Support

For additional support, contact support@baydynamics.com.

Including relevant information from the log files will help us resolve your issue.
